Known-tire speed
new-code decode: 0.1s to 40s (live, paid)

Only 2 tire codes are wired for instant deterministic ID today. Testing NEW or unknown tire codes (how it reacts, how long it takes) runs through the live decode pipeline, which costs API money. Say the word and I will add a weekly 15 to 20 unknown-tire decode test with accuracy and timing.

WHAT TO DO

DO NOW

- **Hide the test-only switches.** "Simulate sync failure" and "Go offline" show on the live scan screen; a clerk could break their session by accident.
- **Move Delete out of the scan zone.** It sits next to Correct in every counts row, right where fast scanning happens.

DO NEXT

- **Lighten the counts table.** 13 columns and 4 buttons per row; show the essentials and hide the rest until tapped.
- **Raise contrast for the aisle.** The status line and red-on-pink alert are hard to read in warehouse light.

DO LATER

- **Wire more tires.** Grow the deterministic tire corpus past 2 so common tires resolve instantly with no AI cost.

BEFORE YOU FORGET

109 files uncommitted and 28 commits unpushed on decoder-hardening-v1-local. Push when you are ready.

Reviewed across 14 lenses on captured local screenshots; offline tire corpus checked at \$0. Full 27-agent fleet runs Sundays 6pm or on demand (npm run intel:now). Runs on your Claude subscription. Report-only: nothing in your app was changed.
