

Decode finds the right tire 93% of the time, but auto-verifies 0%. That is the gap to close.

15 FRESH tire codes through the live pipeline this week (new codes each run, so the cache cannot fake the speed). It identified the correct brand 93% of the time, but auto-verified 0% - every found tire was routed to needs-review as a "suggestion" instead of being counted. False auto-counts: 0 (safe). The gap is the verify gate, not the finding.

Decode spend this run: about \$0.036 for 16 codes (mini models: 14 firecrawl credits, 17 gemini, 17 openai calls). Codes already in your database cost \$0.

WHAT TO DO

DO NOW

- blocker

Close the needs-review gap on tires. Root cause confirmed in code: the app only stamps a tire "verified" when it independently confirms the exact barcode in strong evidence (a real product page or Google grounding, not a barcode-lookup link, which it distrusts on purpose). Your tires get the brand right but from weak link-only evidence, so they correctly drop to "suggested" and into review. To auto-count them, the pipeline must open and confirm the product page, read full specs (size, load, speed), and clear 90% confidence.
- high

Speed up the decode. Root cause confirmed in code: there is no quick barcode-database lookup, so any tire not already in your database falls to the slow deep fallback, which runs the AI out to a 10-second timeout every time (up to a 30-second ceiling when the web search also misses). Add a fast barcode lookup, run providers in parallel, and cache.

DO NEXT

- low

Tidy the platform-owner controls on the scan screen. Verified, and smaller than it first looked: "Simulate sync failure", "Go offline", and "Delete" sit on the scan screen, but only the platform owner sees them (customers never do) and Delete already asks for confirmation. Worth moving to Settings for polish, not a risk to a normal clerk.

DO LATER

- low

Grow the deterministic tire database. Every tire you wire in resolves instantly at \$0 and never touches the AI. You are already building this toward 30k.

BEFORE YOU FORGET

109 files uncommitted and 28 commits unpushed on decoder-hardening-v1-local. Push when you are ready.

Findings verified against the live decode run and the source code before printing - two overstated UX items were demoted after a code check (the style guide rule: verify before you print). Full pipeline runs Sundays 6pm or on demand (npm run intel:now) on your Claude subscription. Report-only: nothing in your app was changed.
