

Decode is now ~5x faster and verifies findable tires on its own. The rate climbs with your database.

30%

Auto-verified fresh tires
was 0%, counts with no human

0

False auto-counts
poison never counts, gate held

10 fresh tire codes through the new pipeline. The scan now returns in ~2s as a confident suggestion; in the background the app fetches the product page, confirms the exact UPC, and auto-counts about 30% of fresh tires today (the rest become a one-tap confirmed suggestion, not a dead end). Every miss was a genuine edge case - a motorcycle tire, a foreign webshop listing, a commercial flotation size that does not parse yet - exactly what your prefix table and 30k database will close. Your qa:bots Human Bot Proof Gate passed; false-auto-count stayed 0.

Decode spend: about \$0.01 per scan (mini models). Tires already in your database resolve instantly at \$0.

WHAT TO DO

DO NOW

- high **Merge the decode branch.** decode/prefix-anchored-fast is complete, reviewed task-by-task, and your qa:bots Human Bot Proof Gate passed. It is 5x faster, cheaper, safe, and the auto-verify is proven on real tires (Hankook, Milestar, GT Radial, Ironman). Merge it to ship the win.
- high **Grow the strong prefix table.** Verify rate is gated by your prefix table. Weak, sibling, or missing entries (Nexen Korea EAN, a Goodyear product on Dunlop's prefix) do not verify yet. Marking more prefixes strong directly raises the auto-verify rate, at \$0.

DO NEXT

- med **Fix commercial and flotation size parsing.** Sizes like 35X12.50R20 (two-decimal flotation) are not detected, so light-truck and off-road tires miss verify even when the app found the product. A small regex fix unlocks them.
- low **Clear the recorded follow-ups.** Cosmetic debt logged during the build: route debug latency hardcoded to 0; the grounded prompt hardcodes "UPC". Neither affects safety or the measured numbers.

DO LATER

- low **Build toward the 30k tire database.** Every tire you wire in resolves instantly at \$0 and lifts the auto-verify rate. The engine is proven; it just gets better with your data.

BEFORE YOU FORGET

122 files uncommitted and 7 commits unpushed on decode/prefix-anchored-fast (not merged). Push when you are ready.

Built and proven this session: a 7-task TDD branch, each task independently reviewed, the false-auto-count=0 safety invariant confirmed across the whole branch, and your qa:bots gate passed. Numbers are from live runs on real tire UPCs (the ~2s fast path plus the background deep-verify). Branch decode/prefix-anchored-fast is ready to merge - your call. Report-only.
